# Procurement
# that never stalls.

Describe a need. The agent finds vendors, chases quotes, and ranks every offer.

Rules decide · AI explains · Human approves

Vultr Agent Rush 2026 · Challenge 2

Live demo: fastprok.kekere.online

THE PROBLEM

# A purchase request is a week of coordination.

01

## Find the right vendors

Category, region, lead time, and past reliability all matter. The wrong invite wastes a week.

02

## Chase the quiet ones

Silent vendors need reminders. Buyers need a record of who was asked and who replied.

03

## Compare what is not comparable

Price, delivery, warranty, and reliability arrive in different shapes. The decision still has to be defensible.

**The work is coordination, not typing.**

THE PRODUCT

# One paragraph in. A decision out.

1

## Describe

One paragraph in plain language.

→

2

## Structure

Vultr inference fills the fields.

→

3

## Invite & chase

Rules match vendors. The agent follows up.

→

4

## Rank

Deterministic scores. AI writes the reason.

→

5

## Approve

A human makes the final call.

**The agent does the chasing.** Reminders, one-time widening, deadline ranking, and every event on a single timeline.

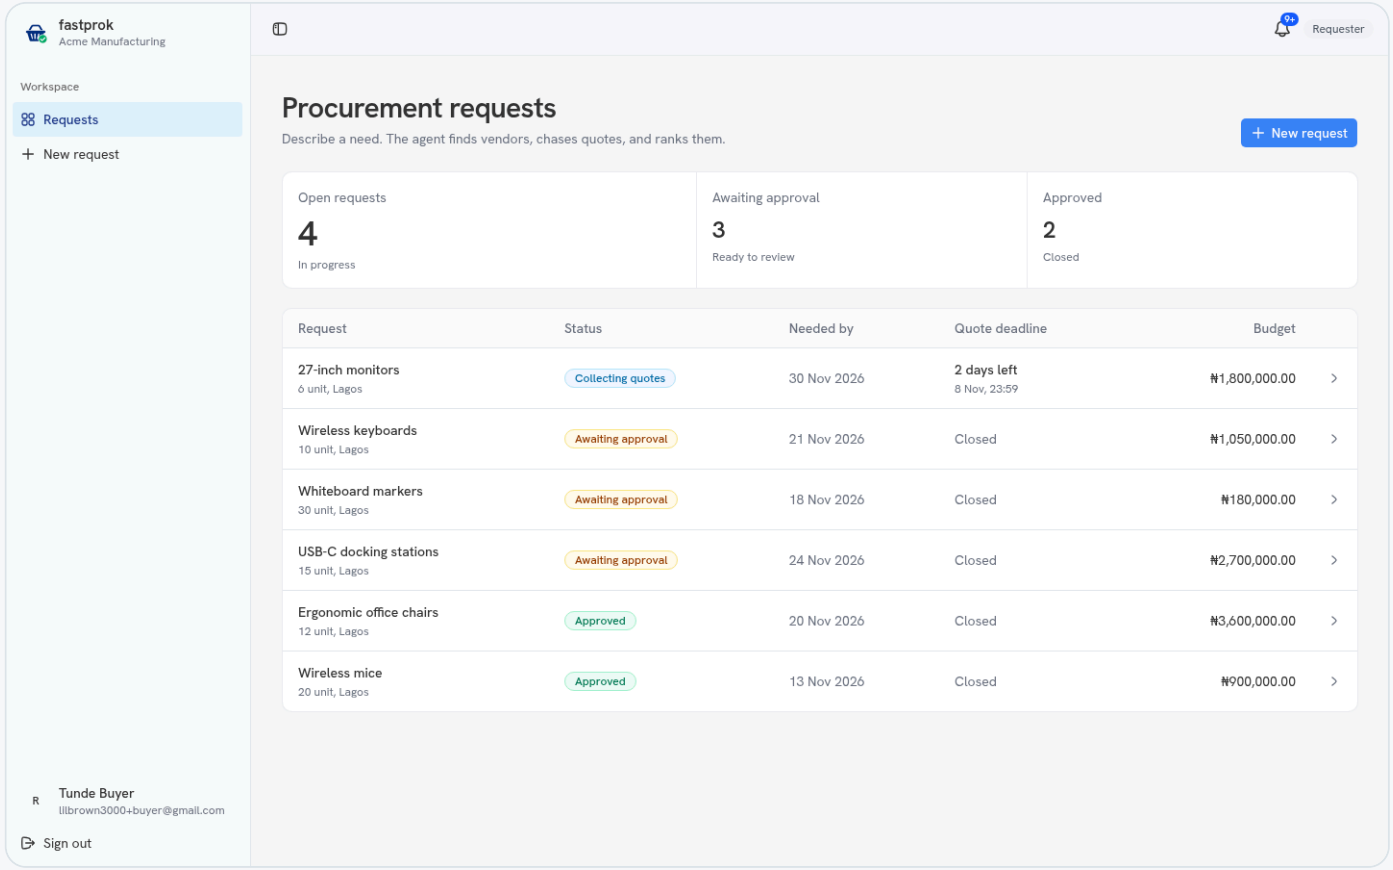

**The human keeps the call.** Only an organization approver can approve. The agent never spends.

REQUESTER

# The requester sees the whole purchase.

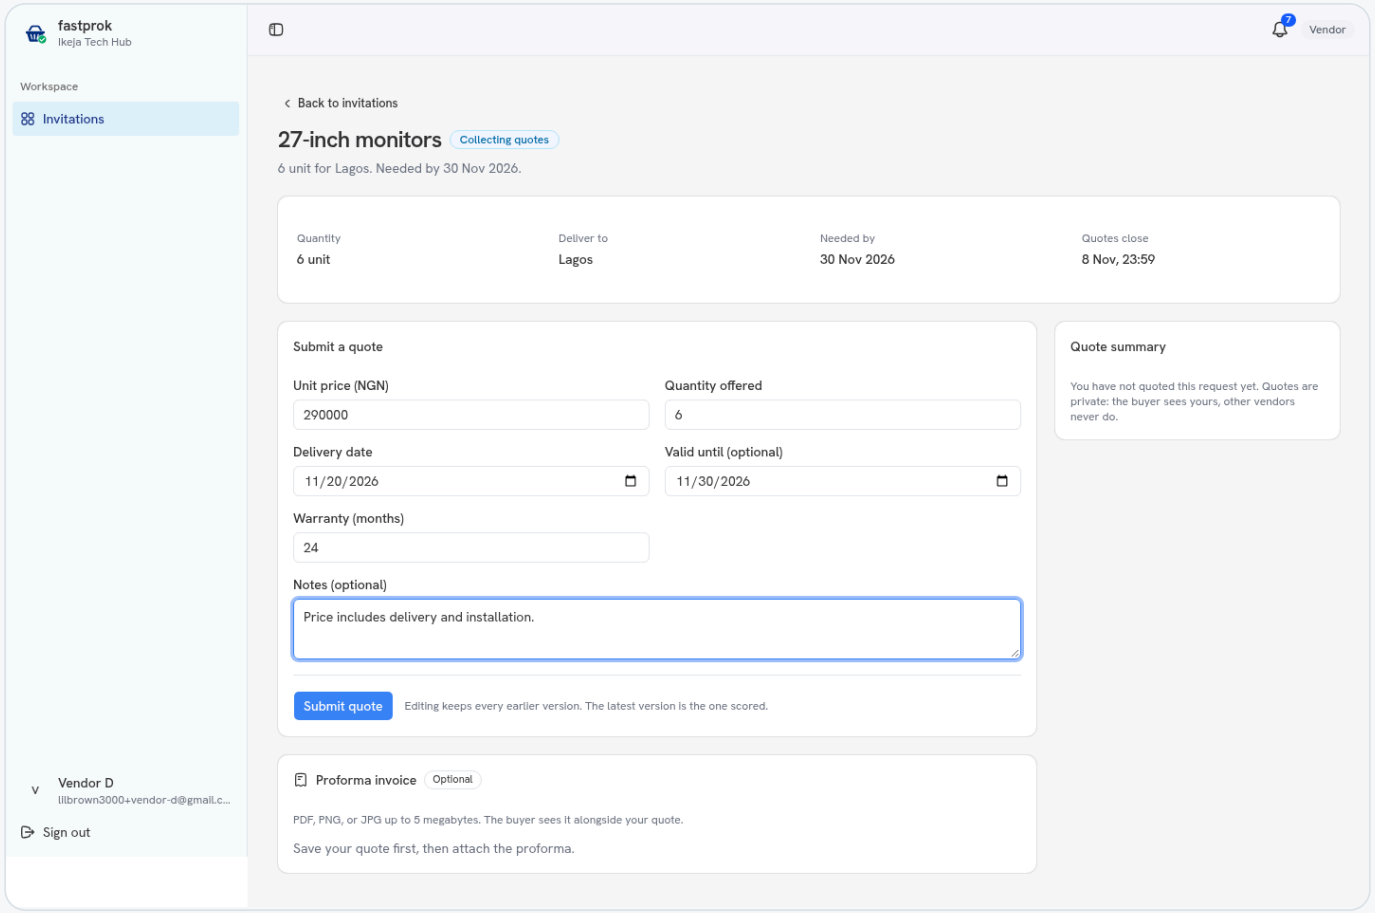

- A paragraph becomes structured fields: quantity, region, budget, and deadline.
- Matched vendors and every invitation are visible.
- Quotes arrive with a score breakdown, flags, and an AI reason.
- Every agent action lands on one timeline.

The bell keeps the buyer ahead: invitations, quotes, proformas, and approvals.

VENDOR

# Vendors get one clear job.

- Only their own invitation and their own quote.
- Every revision is kept; the latest version is scored.
- An optional proforma invoice sits beside the quote.
- The outcome is visible after approval.

**Private by default.** Proformas live in a private bucket and open through five-minute presigned links after an access check.

THE DECISION

# Rules decide. AI explains.

## Deterministic scoring

| Priority | Cost | Delivery | Reliability | Warranty |
|---|---|---|---|---|
| Balanced | 35% | 30% | 30% | 5% |
| Lowest price | 60% | 15% | 20% | 5% |
| Fastest | 15% | 60% | 20% | 5% |
| Most reliable | 15% | 20% | 60% | 5% |

Hard filters first: quantity, delivery by the needed-by date, and on-time submission. Ties break on earlier submission.

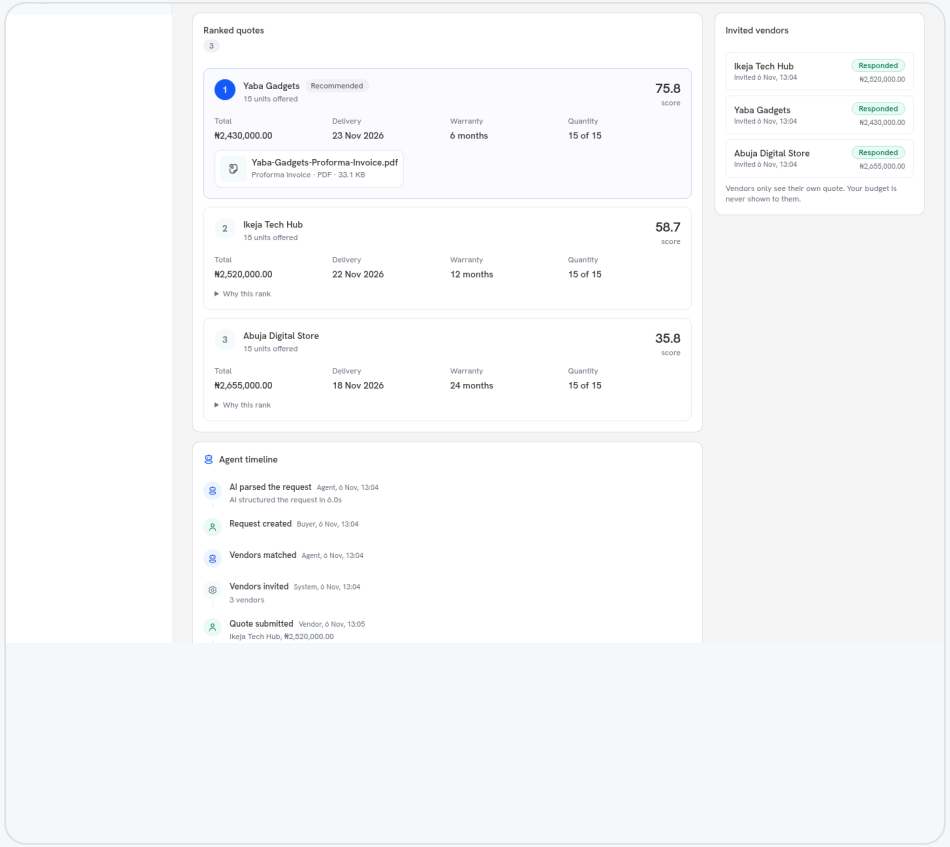

## AI's limited job

- Parse the request into structured fields.
- Write the recommendation summary from the scored numbers.
- Never change the ranking. Never approve.

If the model fails, a deterministic template is used and the fallback is logged.

THE DECISION

# Every rank has a number behind it.

- Hard filters remove quotes that miss quantity or delivery.
- Cost, speed, reliability, and warranty are normalized and weighted.
- Flags surface over-budget, partial, late, or late-submitted quotes.
- The AI reason cites only the scored data.

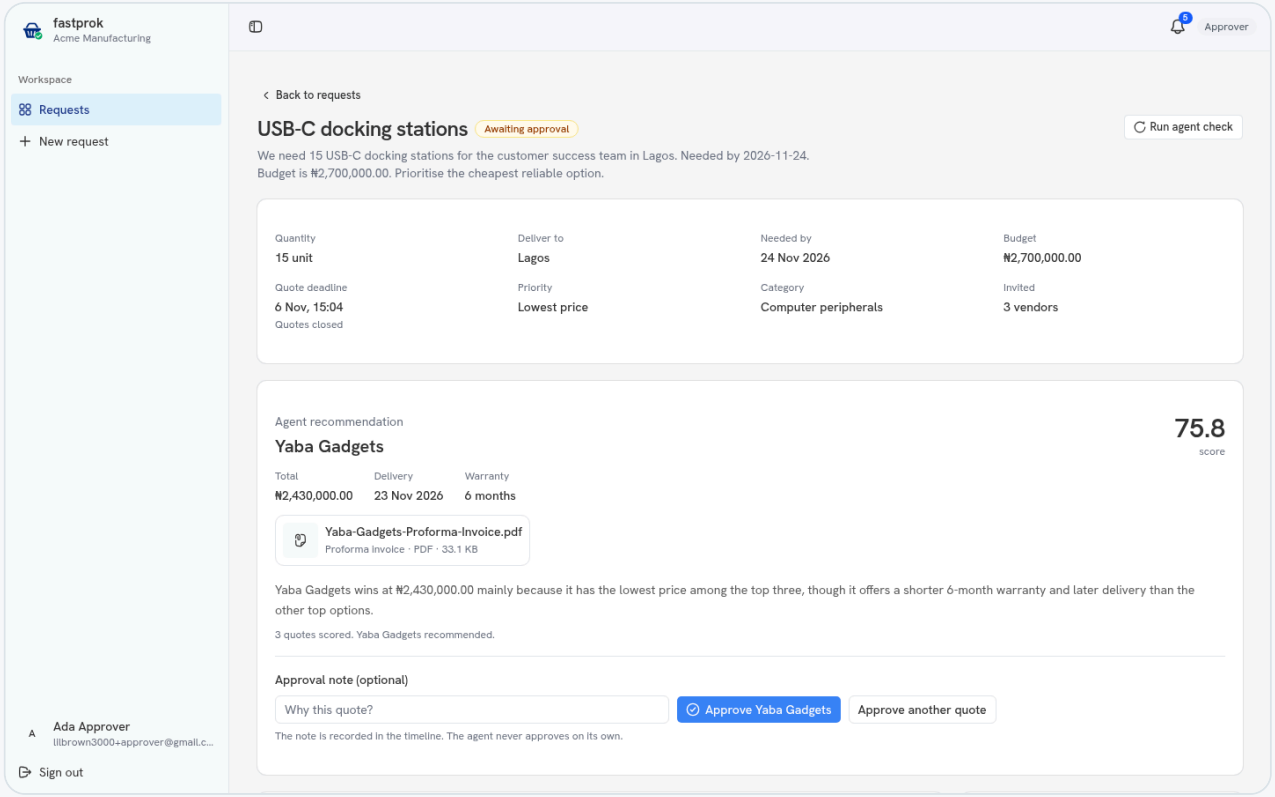

The same input always produces the same ranking. The model only writes the explanation.

HUMAN CONTROL

# Only an approver can spend.

- Approvers see the recommendation, the score breakdown, and the proforma.
- Requesters can view and recommend, but cannot approve.
- The approval note is recorded in the timeline.
- The winning vendor and the rest are notified.

Proformas are private: access is checked, then a five-minute presigned URL is issued.

ARCHITECTURE

# One Bun server, four Vultr services.

Requester | Approver | Vendor

**TanStack Start on Bun** · React UI · oRPC · domain services with better-result · Drizzle

↓

### Managed PostgreSQL

Requests, quotes, users, sessions, notifications, outbox.

### Object Storage

Private proforma invoices, S3-compatible.

### Serverless Inference

deepseek-v4.1-flash-1017 for parse and explanation.

### Resend

Invitation, reminder, and outcome emails.

**Dokploy on a Vultr Cloud Compute VM** · agent scheduler every 60 seconds · SSL required for PostgreSQL

WHY IT HOLDS UP

# Built for a demo that has to be believed.

## Deterministic

Hard filters, normalized scores, explicit weights, and stable tie-breaks. Same input, same ranking.

## Auditable

Every parse, invite, quote, rank, proforma, and approval is on the timeline with an actor and a time.

## Private

Vendors see only their own quote. Proformas are access-checked and served through short-lived links.

## Demo-ready

One-click roles, seeded data, in-app notifications, optional browser alerts, and a working approval path.

Deliberately out of scope for this demo: inbound email parsing, delivery tracking, multi-currency, member invites, and a rejection flow.

fastprok

# A purchase that never stalls.

DEMO ACCOUNTS · PASSWORD demo1234

Requester lilbrown3000+buyer@gmail.com
Approver lilbrown3000+approver@gmail.com
Vendor lilbrown3000+vendor-d@gmail.com

TRY THE 3-MINUTE PATH

1. Requester: open **27-inch monitors**.
2. Vendor: quote, attach a proforma, edit.
3. Requester: rank the quote.
4. Approver: approve **USB-C docking stations**.
